Note:  $\phi$  satisfiable  $\iff \llbracket \phi \rrbracket \neq \emptyset$

## 5 Gradualization

### 5.1 Syntax

#### 5.1.1 Gradual formula

$$\tilde{\phi} ::= \phi \mid ? * \phi$$

Note: consider  $?$  in other positions as “self-framing delimiter”, but with semantically identical meaning.

As long as  $?$  is only legal in the front though:  $\phi_1 * \tilde{\phi}_2$  propagates the  $?$  to the very left in case  $\phi_2$  contains one.

#### 5.1.2 Type judgment expansion

Motivation: Materialize and combine the requirements on  $\phi$ .

Designed so that

$$\begin{aligned} \phi \vdash e : T \quad \wedge \quad [\phi] \vdash_{\mathbf{sfrm}} e \\ \iff \\ [e : T]_C \quad \wedge \quad \phi \implies \llbracket e : T \rrbracket_C \end{aligned}$$

**Expand into premise:**  $[e : T]_C$

$$\begin{aligned} [v : T]_C &= T = C \quad \wedge \quad \vdash v : T \\ [x : T]_C &= T = C \\ [e.f : T]_C &= [e : C']_C \quad \wedge \quad \vdash C'.f : T \end{aligned}$$

**Expand into formula:**  $\llbracket e : T \rrbracket_C$

$$\begin{aligned} \llbracket v : T \rrbracket_C &= \mathbf{true} \\ \llbracket x : T \rrbracket_C &= (x : C) \\ \llbracket e.f : T \rrbracket_C &= \llbracket e : T \rrbracket_C * \mathbf{acc}(e.f) \end{aligned}$$

## 5.2 Concretization

Syntax  $\hat{\phi} :=$  self-framed and satisfiable  $\phi$

$$\begin{aligned} \gamma(\hat{\phi}) &= \{ \hat{\phi} \} \\ \gamma(? * \phi') &= \{ \hat{\phi} \mid \hat{\phi} \implies \phi' \} \text{ if } \phi' \text{ satisfiable} \\ \gamma(\phi) &\text{ undefined otherwise} \end{aligned}$$

## 5.3 Abstraction

$$\begin{aligned} \alpha(\emptyset) &\text{ undefined} \\ \alpha(\{ \phi \}) &= \phi \\ \alpha(\overline{\phi} \text{ with maximum element } \phi) &= ? * \phi \\ \alpha(\overline{\phi}) &= ? \text{ otherwise} \end{aligned}$$

## 5.4 Gradual Lifting

### 5.4.1 Self framing

$$\frac{A \vdash_{\text{sfrm}} \phi}{A \vdash_{\text{sfrm}} \widetilde{\phi}} \text{ GSFRMNONGRAD}$$

$$\frac{}{A \vdash_{\text{sfrm}} ? * \phi} \text{ GSFRMGRAD}$$

### 5.4.2 Implication

$$\frac{\phi_1 \implies \phi_2}{\phi_1 \widetilde{\implies} \phi_2} \text{ GIMPLNONGRAD}$$

$$\frac{\phi_m \implies \phi_2 \quad \phi_m \implies \phi_1}{? * \phi_1 \widetilde{\implies} \phi_2} \text{ GIMPLGRAD}$$

$\phi_m$  is evidence!

### Consistent transitivity

While  $\implies$  is transitive,  $\widetilde{\implies}$  is generally not.

But maybe not even necessary with smarter hoare rules?

### 5.4.3 Hoare and evidence

Discussion/Considerations:

- The post-condition- $\phi$  seems to inherit its gradual-ness from implication, which itself does not care about whether its second argument is gradual or not...
- Gradual

Example:

$$\frac{x \notin FV(\tilde{\phi}') \quad x \notin FV(e) \quad \epsilon \vdash \tilde{\phi} \Longrightarrow \tilde{\phi}' \quad \emptyset \vdash_{\text{sfrm}} \tilde{\phi}' \quad \epsilon \vdash \tilde{\phi} \vdash x : T \quad \epsilon \vdash \tilde{\phi} \vdash e : T \quad \epsilon \vdash [\tilde{\phi}'] \vdash_{\text{sfrm}} e}{\vdash \{\tilde{\phi}\}x := e\{\tilde{\phi}' * (x = e)\}} \text{GHVarAssign}$$

Collapsing (hidden) gradual implications into a single one:

$$\frac{\epsilon \vdash \tilde{\phi} \Longrightarrow (x : T) * \llbracket e : T \rrbracket_C * \tilde{\phi}' \quad \emptyset \vdash_{\text{sfrm}} \llbracket e : T \rrbracket_C * \tilde{\phi}' \quad x \notin FV(\tilde{\phi}') \quad x \notin FV(e) \quad [e : T]_C}{\vdash \{\tilde{\phi}\}x := e\{\llbracket e : T \rrbracket_C * \tilde{\phi}' * (x = e)\}} \text{GHVarAssign}$$

When shifting implication responsibility to GHSec:

$$\frac{x \notin FV(\tilde{\phi}') \quad x \notin FV(e) \quad [e : T]_C}{\vdash \{(x : T) * \llbracket e : T \rrbracket_C * \tilde{\phi}'\}x := e\{\llbracket e : T \rrbracket_C * \tilde{\phi}' * (x = e)\}} \text{GHVarAssign}$$

Example derivation:

$$\begin{aligned} & \{(x : T) * (y : C) * \text{acc}(y.a) * \text{acc}(y.a.b) * \text{acc}(y.a.b.c) * \tilde{\phi}'\} \\ & \{(x : T) * \llbracket y.a.b.c : T \rrbracket_C * \tilde{\phi}'\} \\ & x := y.a.b.c; \quad \begin{array}{l} x \notin FV(\tilde{\phi}') \\ x \notin FV(y.a.b.c) \\ \llbracket y.a.b.c : T \rrbracket_C = \vdash C_y = C \wedge \vdash C_{y.a} : C_a \wedge \vdash C_a.b : C_b \wedge \vdash C_b.c : T \end{array} \\ & \{\llbracket y.a.b.c : T \rrbracket_C * \tilde{\phi}' * (x = y.a.b.c)\} \\ & \{(y : C) * \text{acc}(y.a) * \text{acc}(y.a.b) * \text{acc}(y.a.b.c) * \tilde{\phi}' * (x = y.a.b.c)\} \end{aligned}$$
