## 2 Assumptions

All the rules in the following sections are implicitly parameterized over a *program* that is well-formed.

### 2.0.1 Well-formed program (*program* OK)

$$\frac{\overline{cls_i \text{ OK}}}{(\overline{cls_i} \ \bar{s}) \text{ OK}} \text{ OKPROGRAM}$$

### 2.0.2 Well-formed class (*cls* OK)

$$\frac{\text{unique } field\text{-names} \quad \text{unique } method\text{-names} \quad \overline{method_i \text{ OK in } C}}{(\text{class } C \{ \overline{field_i} \ \overline{method_i} \}) \text{ OK}} \text{ OKCLASS}$$

### 2.0.3 Well-formed method (*method* OK in *C*)

$$\frac{x : T_x, \text{this} : C, \text{result} : T_m \vdash \{ \phi_1 \} \bar{s} \{ \phi_2 \} \quad FV(\phi_1) \subseteq \{x, \text{this}\} \quad FV(\phi_2) \subseteq \{x, \text{this}, \text{result}\} \quad \emptyset \vdash_{\text{sfrm}} \phi_1 \quad \emptyset \vdash_{\text{sfrm}} \phi_2 \quad \overline{\neg \text{writesTo}(s_i, x)}}}{(T_m \ m(T_x \ x) \ \text{requires } \phi_1; \ \text{ensures } \phi_2; \ \{ \bar{s} \}) \text{ OK in } C} \text{ OKMETHOD}$$

## 3 Static semantics

### 3.1 Expressions ( $A_s \vdash_{\text{sfrm}} e$ )

$$\frac{}{A \vdash_{\text{sfrm}} x} \text{ WFVAR}$$

$$\frac{}{A \vdash_{\text{sfrm}} v} \text{WFVALUE}$$

$$\frac{(e, f) \in A \quad A \vdash_{\text{sfrm}} e}{A \vdash_{\text{sfrm}} e.f} \text{WFFIELD}$$

### 3.2 Formulas ( $A_s \vdash_{\text{sfrm}} \phi$ )

$$\frac{}{A \vdash_{\text{sfrm}} \text{true}} \text{WFTTRUE}$$

$$\frac{A \vdash_{\text{sfrm}} e_1 \quad A \vdash_{\text{sfrm}} e_2}{A \vdash_{\text{sfrm}} (e_1 = e_2)} \text{WFEQUAL}$$

$$\frac{A \vdash_{\text{sfrm}} e_1 \quad A \vdash_{\text{sfrm}} e_2}{A \vdash_{\text{sfrm}} (e_1 \neq e_2)} \text{WFNEQUAL}$$

$$\frac{A \vdash_{\text{sfrm}} e}{A \vdash_{\text{sfrm}} \text{acc}(e.f)} \text{WFACC}$$

$$\frac{A_s \vdash_{\text{sfrm}} \phi_1 \quad A_s \cup [\phi_1] \vdash_{\text{sfrm}} \phi_2}{A_s \vdash_{\text{sfrm}} \phi_1 * \phi_2} \text{WFSEPOP}$$

#### 3.2.1 Implication ( $\phi_1 \Rightarrow \phi_2$ )

Conservative approx. of  $\phi_1 \Rightarrow \phi_2$ .

### 3.3 Footprint ( $[\phi] = A_s$ )

$$\begin{array}{ll} [\text{true}] & = \emptyset \\ [(e_1 = e_2)] & = \emptyset \\ [(e_1 \neq e_2)] & = \emptyset \\ [\text{acc}(e.f)] & = \{(e, f)\} \\ [\phi_1 * \phi_2] & = [\phi_1] \cup [\phi_2] \end{array}$$

### 3.4 Type ( $\Gamma \vdash e : T$ )

$$\frac{}{\Gamma \vdash n : \text{int}} \text{STVALNUM}$$

$$\frac{}{\Gamma \vdash \text{null} : T} \text{STVALNULL}$$

$$\frac{\Gamma(x) = T}{\Gamma \vdash x : T} \text{STVAR}$$

$$\frac{\Gamma \vdash e : C \quad \vdash C.f : T}{\Gamma \vdash e.f : T} \text{STFIELD}$$

### 3.5 Hoare ( $\Gamma \vdash \{\phi\} \bar{s}\{\phi\}$ )

$$\frac{\phi \implies \phi' \quad \emptyset \vdash_{\text{sfrm}} \phi' \quad x \notin FV(\phi') \quad \Gamma \vdash x : C \quad \text{fields}(C) = \bar{f}}{\Gamma \vdash \{\phi\} x := \text{new } C; \{\phi' * (x \neq \text{null}) * \text{acc}(x, f_i)\}} \text{HNEWOBJ}$$

$$\frac{\phi \implies \text{acc}(x.f) * \phi' \quad \emptyset \vdash_{\text{sfrm}} \phi' \quad \Gamma \vdash x : C \quad \Gamma \vdash y : T \quad \vdash C.f : T}{\Gamma \vdash \{\phi\} x.f := y; \{\phi' * \text{acc}(x.f) * (x \neq \text{null}) * (x.f = y)\}} \text{HFIELDASSIGN}$$

$$\frac{\phi \implies \phi' \quad \emptyset \vdash_{\text{sfrm}} \phi' \quad x \notin FV(\phi') \quad x \notin FV(e) \quad \Gamma \vdash x : T \quad \Gamma \vdash e : T \quad \llbracket e \rrbracket \subseteq \phi'}{\Gamma \vdash \{\phi\} x := e; \{\phi' * (x = e)\}} \text{HVARASSIGN}$$

$$\frac{\phi \implies \phi' \quad \emptyset \vdash_{\text{sfrm}} \phi' \quad \text{result} \notin FV(\phi') \quad \Gamma \vdash x : T \quad \Gamma \vdash \text{result} : T}{\Gamma \vdash \{\phi\} \text{return } x; \{\phi' * (\text{result} = x)\}} \text{HRETURN}$$

$$\frac{\begin{array}{l} \Gamma \vdash y : C \quad \text{mmethod}(C, m) = T_r \ m(T_p \ z) \text{ requires } \phi_{pre}; \text{ ensures } \phi_{post}; \{ \_ \} \\ \Gamma \vdash x : T_r \quad \Gamma \vdash z' : T_p \quad \phi \implies (y \neq \text{null}) * \phi_p * \phi' \quad \emptyset \vdash_{\text{sfrm}} \phi' \\ x \notin FV(\phi') \quad x \neq y \wedge x \neq z' \quad \phi_p = \phi_{pre}[y, z'/\text{this}, z] \quad \phi_q = \phi_{post}[y, z', x/\text{this}, z, \text{result}] \end{array}}{\Gamma \vdash \{\phi\} x := y.m(z'); \{\phi' * \phi_q\}} \text{HAPP}$$

$$\frac{\phi \implies \phi'}{\Gamma \vdash \{\phi\} \text{assert } \phi'; \{\phi\}} \text{HASSERT}$$

$$\frac{\phi \implies \phi_r * \phi' \quad \emptyset \vdash_{\text{sfrm}} \phi'}{\Gamma \vdash \{\phi\} \text{release } \phi_r; \{\phi'\}} \text{HRELEASE}$$

$$\frac{x \notin \text{dom}(\Gamma) \quad \Gamma, x : T \vdash \{(x = \text{defaultValue}(T)) * \phi\} \bar{s}\{\phi'\}}{\Gamma \vdash \{\phi\} T \ x; \bar{s}\{\phi'\}} \text{HDECLARE}$$

$$\frac{\Gamma \vdash \{\phi_p\} \bar{s}_1\{\phi_q\} \quad \Gamma \vdash \{\phi_q\} \bar{s}_2\{\phi_r\}}{\Gamma \vdash \{\phi_p\} \bar{s}_1; \bar{s}_2\{\phi_r\}} \text{HSEC}$$

#### 3.5.1 Notation

$$\frac{\hat{\phi} \implies \hat{\phi}' \quad x \notin FV(\hat{\phi}') \quad \Gamma \vdash x : C \quad \text{fields}(C) = \bar{f}}{\Gamma \vdash \{\hat{\phi}\} x := \text{new } C \{\hat{\phi}' \hat{*} (x \neq \text{null}) \hat{*} \text{acc}(x, f_i)\}} \text{HNEWOBJ}$$

$$\frac{\hat{\phi} \Longrightarrow \hat{\phi}' \quad \text{result} \notin FV(\hat{\phi}') \quad \Gamma \vdash x : T \quad \Gamma \vdash \text{result} : T}{\Gamma \vdash \{\hat{\phi}\} \text{return } x \{\hat{\phi}' \hat{*} (\text{result} = x)\}} \text{HRETURN}$$

$$\frac{\Gamma \vdash y : C \quad \text{mmethod}(C, m) = T_r \ m(T_p \ z) \ \text{requires } \hat{\phi}_{pre}; \ \text{ensures } \hat{\phi}_{post}; \ \{\_\} \quad \Gamma \vdash x : T_r \quad \Gamma \vdash z' : T_p \quad \hat{\phi} \Longrightarrow (y \neq \text{null}) * \hat{\phi}_p * \hat{\phi}' \quad x \notin FV(\hat{\phi}') \quad x \neq y \wedge x \neq z' \quad \hat{\phi}_p = \hat{\phi}_{pre}[y, z' / \text{this}, z] \quad \hat{\phi}_q = \hat{\phi}_{post}[y, z', x / \text{this}, z, \text{result}]}{\Gamma \vdash \{\hat{\phi}\} x := y.m(z') \{\hat{\phi}' * \hat{\phi}_q\}} \text{HAPP}$$

$$\frac{\hat{\phi} \Longrightarrow \hat{\phi}'}{\Gamma \vdash \{\hat{\phi}\} \text{assert } \hat{\phi}' \{\hat{\phi}\}} \text{HASSERT}$$

$$\frac{\hat{\phi} \Longrightarrow \phi_r * \hat{\phi}'}{\Gamma \vdash \{\hat{\phi}\} \text{release } \phi_r \{\hat{\phi}'\}} \text{HRELEASE}$$

$$\frac{x \notin \text{dom}(\Gamma) \quad \Gamma, x : T \vdash \{\hat{\phi} \hat{*} (x = \text{defaultValue}(T))\} \bar{s} \{\hat{\phi}'\}}{\Gamma \vdash \{\hat{\phi}\} T \ x; \bar{s} \{\hat{\phi}'\}} \text{HDECLARE}$$

$$\frac{\Gamma \vdash \{\hat{\phi}_p\} \bar{s}_1 \{\hat{\phi}_q\} \quad \Gamma \vdash \{\hat{\phi}_q\} \bar{s}_2 \{\hat{\phi}_r\}}{\Gamma \vdash \{\hat{\phi}_p\} \bar{s}_1; \bar{s}_2 \{\hat{\phi}_r\}} \text{HSEC}$$

### 3.5.2 Deterministic

$$\frac{\hat{\phi}[\mathbf{w/o} \ x] = \hat{\phi}' \quad \Gamma \vdash x : C \quad \text{fields}(C) = \bar{f}}{\Gamma \vdash \{\hat{\phi}\} x := \text{new } C \{\hat{\phi}' \hat{*} (x \neq \text{null}) \hat{*} \text{acc}(x, f_i)\}} \text{HNEWOBJ}$$

$$\frac{\hat{\phi}[\mathbf{w/o} \ \text{acc}(x.f)] = \hat{\phi}' \quad \hat{\phi} \Longrightarrow \text{acc}(x.f) \quad \Gamma \vdash x : C \quad \Gamma \vdash y : T \quad \vdash C.f : T}{\Gamma \vdash \{\hat{\phi}\} x.f := y \{\hat{\phi}' \hat{*} \text{acc}(x.f) \hat{*} (x \neq \text{null}) \hat{*} (x.f = y)\}} \text{HFIELDASSIGN}$$

$$\frac{\hat{\phi}[\mathbf{w/o} \ x] = \hat{\phi}' \quad x \notin FV(e) \quad \Gamma \vdash x : T \quad \Gamma \vdash e : T \quad \hat{\phi}' \Longrightarrow \llbracket e \rrbracket}{\Gamma \vdash \{\hat{\phi}\} x := e \{\hat{\phi}' \hat{*} (x = e)\}} \text{HVARASSIGN}$$

Have  $\hat{*}$  take care of necessary congruent rewriting of  $e$  in order to preserve self-framing!

$$\frac{\hat{\phi}[\mathbf{w/o} \ \text{result}] = \hat{\phi}' \quad \Gamma \vdash x : T \quad \Gamma \vdash \text{result} : T}{\Gamma \vdash \{\hat{\phi}\} \text{return } x \{\hat{\phi}' \hat{*} (\text{result} = x)\}} \text{HRETURN}$$

$$\frac{\Gamma \vdash y : C \quad \text{mmethod}(C, m) = T_r \ m(T_p \ z) \ \text{requires } \hat{\phi}_{pre}; \ \text{ensures } \hat{\phi}_{post}; \ \{\_\} \quad \Gamma \vdash x : T_r \quad \Gamma \vdash z' : T_p \quad \hat{\phi} \Longrightarrow \hat{\phi}_p \hat{*} (y \neq \text{null}) \quad x \neq y \wedge x \neq z' \quad \hat{\phi}_p = \hat{\phi}_{pre}[y, z' / \text{this}, z] \quad \hat{\phi}_q = \hat{\phi}_{post}[y, z', x / \text{this}, z, \text{result}]}{\Gamma \vdash \{\hat{\phi}\} x := y.m(z') \{\hat{\phi}' \hat{*} \hat{\phi}_q\}} \text{HAPP}$$

$$\frac{\hat{\phi} \Longrightarrow \phi_a}{\Gamma \vdash \{\hat{\phi}\} \mathbf{assert} \phi_a \{\hat{\phi}\}} \text{HASSERTBAD (GRAD LIFTING NON-TRIVIAL!)}$$

$$\frac{\hat{\phi}[\mathbf{w/o} \lfloor \phi_a \rfloor] = \hat{\phi}' \quad \hat{\phi} \Longrightarrow \phi_a}{\Gamma \vdash \{\hat{\phi}\} \mathbf{assert} \phi_a \{\hat{\phi}' \hat{*} \phi_a\}} \text{HASSERT}$$

$$\frac{\hat{\phi}[\mathbf{w/o} \lfloor \phi_r \rfloor] = \hat{\phi}' \quad \hat{\phi} \Longrightarrow \phi_r}{\Gamma \vdash \{\hat{\phi}\} \mathbf{release} \phi_r \{\hat{\phi}'\}} \text{HRELEASE}$$

$$\frac{x \notin \text{dom}(\Gamma) \quad \Gamma, x : T \vdash \{\hat{\phi} \hat{*} (x = \text{defaultValue}(T))\} \bar{s} \{\hat{\phi}'\}}{\Gamma \vdash \{\hat{\phi}\} T x; \bar{s} \{\hat{\phi}'\}} \text{HDECLARE}$$

$$\frac{\Gamma \vdash \{\hat{\phi}_p\} s_1 \{\hat{\phi}_q\} \quad \Gamma \vdash \{\hat{\phi}_q\} \bar{s}_2 \{\hat{\phi}_r\}}{\Gamma \vdash \{\hat{\phi}_p\} s_1; \bar{s}_2 \{\hat{\phi}_r\}} \text{HSEC}$$

### 3.5.3 Gradual

$$\frac{\tilde{\phi}[\mathbf{w/o} x] = \tilde{\phi}' \quad \Gamma \vdash x : C \quad \text{fields}(C) = \bar{f}}{\Gamma \vdash \{\tilde{\phi}\} x := \mathbf{new} C \{\tilde{\phi}' \tilde{*} (x \neq \mathbf{null}) \tilde{*} \mathbf{acc}(x, f_i)\}} \text{GHNEWOBJ}$$

$$\frac{\tilde{\phi}[\mathbf{w/o} \mathbf{acc}(x.f)] = \tilde{\phi}' \quad \tilde{\phi} \widetilde{\Longrightarrow} \mathbf{acc}(x.f) \quad \Gamma \vdash x : C \quad \Gamma \vdash y : T \quad \vdash C.f : T}{\Gamma \vdash \{\tilde{\phi}\} x.f := y \{\tilde{\phi}' \tilde{*} \mathbf{acc}(x.f) \tilde{*} (x \neq \mathbf{null}) \tilde{*} (x.f = y)\}} \text{GHFIELDASSIGN}$$

$$\frac{\tilde{\phi}[\mathbf{w/o} x] = \tilde{\phi}' \quad x \notin FV(e) \quad \Gamma \vdash x : T \quad \Gamma \vdash e : T \quad \tilde{\phi}' \widetilde{\Longrightarrow} \llbracket e \rrbracket}{\Gamma \vdash \{\tilde{\phi}\} x := e \{\tilde{\phi}' \tilde{*} (x = e)\}} \text{GHVARASSIGN}$$

Let  $\tilde{*}$  behave like  $\hat{*}$  if first operand is static - otherwise its regular concatenation.

$$\frac{\tilde{\phi}[\mathbf{w/o} \mathbf{result}] = \tilde{\phi}' \quad \Gamma \vdash x : T \quad \Gamma \vdash \mathbf{result} : T}{\Gamma \vdash \{\tilde{\phi}\} \mathbf{return} x \{\tilde{\phi}' \tilde{*} (\mathbf{result} = x)\}} \text{GHRETURN}$$

$$\frac{\begin{array}{l} \Gamma \vdash y : C \quad \text{mmethod}(C, m) = T_r \ m(T_p \ z) \ \mathbf{requires} \ \widetilde{\phi_{pre}}; \ \mathbf{ensures} \ \widetilde{\phi_{post}}; \ \{\_ \} \quad \Gamma \vdash x : T_r \quad \Gamma \vdash z' : T_p \\ \tilde{\phi} \widetilde{\Longrightarrow} \widetilde{\phi_p} \tilde{*} (y \neq \mathbf{null}) \quad x \neq y \wedge x \neq z' \quad \widetilde{\phi_p} = \widetilde{\phi_{pre}[y, z'/\mathbf{this}, z]} \quad \widetilde{\phi_q} = \widetilde{\phi_{post}[y, z', x/\mathbf{this}, z, \mathbf{result}]} \end{array}}{\Gamma \vdash \{\tilde{\phi}\} x := y.m(z') \{\tilde{\phi}' \tilde{*} \widetilde{\phi_q}\}} \text{GHAPP}$$

$$\frac{\tilde{\phi}[\mathbf{w/o} \lfloor \phi_a \rfloor] = \tilde{\phi}' \quad \tilde{\phi} \widetilde{\Longrightarrow} \phi_a}{\Gamma \vdash \{\tilde{\phi}\} \mathbf{assert} \phi_a \{\tilde{\phi}' \tilde{*} \phi_a\}} \text{GHASSERT}$$

$$\frac{\tilde{\phi}[\mathbf{w/o} \lfloor \phi_r \rfloor] = \tilde{\phi}' \quad \tilde{\phi} \widetilde{\Longrightarrow} \phi_r}{\Gamma \vdash \{\tilde{\phi}\} \mathbf{release} \phi_r \{\tilde{\phi}'\}} \text{GHRELEASE}$$

$$\frac{x \notin \text{dom}(\Gamma) \quad \Gamma, x : T \vdash \{\tilde{\phi} \tilde{*} (x = \text{defaultValue}(T))\} \bar{s}\{\tilde{\phi}'\}}{\Gamma \vdash \{\tilde{\phi}\} T \ x; \bar{s}\{\tilde{\phi}'\}} \text{GHDECLARE}$$

$$\frac{\Gamma \vdash \{\tilde{\phi}_p\} s_1 \{\tilde{\phi}_q\} \quad \Gamma \vdash \{\tilde{\phi}_q\} \bar{s}_2 \{\tilde{\phi}_r\}}{\Gamma \vdash \{\tilde{\phi}_p\} s_1; \bar{s}_2 \{\tilde{\phi}_r\}} \text{GHSEC}$$

## 4 Dynamic semantics

### 4.1 Expressions ( $H, \rho \vdash e \Downarrow v$ )

$$\frac{}{H, \rho \vdash x \Downarrow \rho(x)} \text{EEVAR}$$

$$\frac{}{H, \rho \vdash v \Downarrow v} \text{EEVALUE}$$

$$\frac{H, \rho \vdash e \Downarrow o}{H, \rho \vdash e.f \Downarrow H(o)(f)} \text{EEACC}$$

### 4.2 Formulas ( $H, \rho, A \models \phi$ )

$$\frac{}{H, \rho, A \models \text{true}} \text{EATRUE}$$

$$\frac{H, \rho \vdash e_1 \Downarrow v_1 \quad H, \rho \vdash e_2 \Downarrow v_2 \quad v_1 = v_2}{H, \rho, A \models (e_1 = e_2)} \text{EAEQUAL}$$

$$\frac{H, \rho \vdash e_1 \Downarrow v_1 \quad H, \rho \vdash e_2 \Downarrow v_2 \quad v_1 \neq v_2}{H, \rho, A \models (e_1 \neq e_2)} \text{EANEQUAL}$$

$$\frac{H, \rho \vdash e \Downarrow o \quad H, \rho \vdash e.f \Downarrow v \quad (o, f) \in A}{H, \rho, A \models \text{acc}(e.f)} \text{EAACC}$$

$$\frac{A_1 = A \setminus A_2 \quad H, \rho, A_1 \models \phi_1 \quad H, \rho, A_2 \models \phi_2}{H, \rho, A \models \phi_1 * \phi_2} \text{EASEPOP}$$

We give a denotational semantics of formulas as  $\llbracket \phi \rrbracket = \{ (H, \rho, A) \mid H, \rho, A \models \phi \}$

Note:  $\phi$  satisfiable  $\iff \llbracket \phi \rrbracket \neq \emptyset$

#### 4.2.1 Implication ( $\phi_1 \implies \phi_2$ )

$$\phi_1 \implies \phi_2 \iff \forall H, \rho, A : H, \rho, A \models \phi_1 \implies H, \rho, A \models \phi_2$$

Drawn from def. of entailment in “A Formal Semantics for Isorecursive and Equirecursive State Abstractions”.

### 4.2.2 Implying inequality

$$\begin{aligned}
& \phi * (e_1 = e_1) * (e_2 = e_2) \implies (e_1 \neq e_2) \\
= & \forall H, \rho, A : H, \rho, A \models \phi * (e_1 = e_1) * (e_2 = e_2) \implies H, \rho, A \models (e_1 \neq e_2) \\
= & \forall H, \rho, A : (\exists v_1, v_2 : H, \rho \vdash e_1 \Downarrow v_1 \wedge H, \rho \vdash e_2 \Downarrow v_2 \wedge H, \rho, A \models \phi) \implies (\exists v_1, v_2 : H, \rho \vdash e_1 \Downarrow v_1 \wedge H, \rho \vdash e_2 \Downarrow v_2 \wedge (v_1 \neq v_2)) \\
= & \forall H, \rho, A, v_1, v_2 : (H, \rho \vdash e_1 \Downarrow v_1 \wedge H, \rho \vdash e_2 \Downarrow v_2 \wedge H, \rho, A \models \phi) \implies (\exists v_1, v_2 : H, \rho \vdash e_1 \Downarrow v_1 \wedge H, \rho \vdash e_2 \Downarrow v_2 \wedge (v_1 \neq v_2)) \\
= & \forall H, \rho, A, v_1, v_2 : (H, \rho \vdash e_1 \Downarrow v_1 \wedge H, \rho \vdash e_2 \Downarrow v_2 \wedge H, \rho, A \models \phi) \implies (v_1 \neq v_2) \\
= & \forall H, \rho, A, v_1, v_2 : \neg(H, \rho \vdash e_1 \Downarrow v_1 \wedge H, \rho \vdash e_2 \Downarrow v_2 \wedge H, \rho, A \models \phi) \vee (v_1 \neq v_2) \\
= & \forall H, \rho, A, v_1, v_2 : \neg(H, \rho \vdash e_1 \Downarrow v_1 \wedge H, \rho \vdash e_2 \Downarrow v_2 \wedge H, \rho, A \models \phi \wedge (v_1 = v_2)) \\
= & \forall H, \rho, A : \neg(\exists v_1, v_2 : H, \rho \vdash e_1 \Downarrow v_1 \wedge H, \rho \vdash e_2 \Downarrow v_2 \wedge H, \rho, A \models \phi \wedge (v_1 = v_2)) \\
= & \forall H, \rho, A : \neg(H, \rho, A \models \phi \wedge H, \rho, A \models (e_1 = e_2)) \\
= & \forall H, \rho, A : \neg H, \rho, A \models \phi * (e_1 = e_2) \\
= & \neg \text{sat} (\phi * (e_1 = e_2))
\end{aligned}$$

### 4.3 Footprint ( $\lfloor \phi \rfloor_{H, \rho} = A_d$ )

$$\begin{aligned}
\lfloor \text{true} \rfloor_{H, \rho} &= \emptyset \\
\lfloor e_1 = e_2 \rfloor_{H, \rho} &= \emptyset \\
\lfloor e_1 \neq e_2 \rfloor_{H, \rho} &= \emptyset \\
\lfloor \text{acc}(x.f) \rfloor_{H, \rho} &= \{(o, f)\} \text{ where } H, \rho \vdash x \Downarrow o \\
\lfloor \phi_1 * \phi_2 \rfloor_{H, \rho} &= \lfloor \phi_1 \rfloor_{H, \rho} \cup \lfloor \phi_2 \rfloor_{H, \rho}
\end{aligned}$$

### 4.4 Small-step ( $((H, S) \rightarrow (H, S))$ )

$$\begin{aligned}
& \frac{H, \rho \vdash x \Downarrow o \quad H, \rho \vdash y \Downarrow v_y \quad (o, f) \in A \quad H' = H[o \mapsto [f \mapsto v_y]]}{(H, (\rho, A, x.f := y; \bar{s}) \cdot S) \rightarrow (H', (\rho, A, \bar{s}) \cdot S)} \text{ESFIELDASSIGN} \\
& \frac{H, \rho \vdash e \Downarrow v \quad \rho' = \rho[x \mapsto v]}{(H, (\rho, A, x := e; \bar{s}) \cdot S) \rightarrow (H, (\rho', A, \bar{s}) \cdot S)} \text{ESVARASSIGN} \\
& \frac{\text{fields}(C) = \bar{T} \ \bar{f} \quad \rho' = \rho[x \mapsto o] \quad A' = A * (\bar{o}, \bar{f}_i) \quad H' = H[o \mapsto [\bar{f} \mapsto \text{defaultValue}(\bar{T})]]}{(H, (\rho, A, x := \text{new } C; \bar{s}) \cdot S) \rightarrow (H', (\rho', A', \bar{s}) \cdot S)} \text{ESNEWOBJ} \\
& \frac{H, \rho \vdash x \Downarrow v_x \quad \rho' = \rho[\text{result} \mapsto v_x]}{(H, (\rho, A, \text{return } x; \bar{s}) \cdot S) \rightarrow (H, (\rho', A, \bar{s}) \cdot S)} \text{ESRETURN} \\
& \frac{H, \rho \vdash y \Downarrow o \quad H, \rho \vdash z \Downarrow v \quad H(o) = (C, \_) \quad \text{mmethod}(C, m) = T_r \ m(T \ w) \text{ requires } \phi; \text{ ensures } \_; \{\bar{r}\} \quad \rho' = [\text{result} \mapsto \text{defaultValue}(T_r), \text{this} \mapsto o, w \mapsto v] \quad H, \rho', A \models \phi \quad A' = \lfloor \phi \rfloor_{H, \rho'}}{(H, (\rho, A, x := y.m(z); \bar{s}) \cdot S) \rightarrow (H, (\rho', A', \bar{r}) \cdot (\rho, A \setminus A', x := y.m(z); \bar{s}) \cdot S)} \text{ESAPP} \\
& \frac{H(o) = (C, \_) \quad \text{mpost}(C, m) = \phi \quad H, \rho', A' \models \phi \quad A'' = \lfloor \phi \rfloor_{H, \rho'} \quad H, \rho' \vdash \text{result} \Downarrow v_r}{(H, (\rho', A', \emptyset) \cdot (\rho, A, x := y.m(z); \bar{s}) \cdot S) \rightarrow (H, (\rho[x \mapsto v_r], A * A'', \bar{s}) \cdot S)} \text{ESAPPFINISH}
\end{aligned}$$

$$\frac{H, \rho, A \models \phi}{(H, (\rho, A, \text{assert } \phi; \bar{s}) \cdot S) \rightarrow (H, (\rho, A, \bar{s}) \cdot S)} \text{ESASSERT}$$

$$\frac{H, \rho, A \models \phi \quad A' = A \setminus \lfloor \phi \rfloor_{H, \rho}}{(H, (\rho, A, \text{release } \phi; \bar{s}) \cdot S) \rightarrow (H, (\rho, A', \bar{s}) \cdot S)} \text{ESRELEASE}$$

$$\frac{\rho' = \rho[x \mapsto \text{defaultValue}(T)]}{(H, (\rho, A, T x; \bar{s}) \cdot S) \rightarrow (H, (\rho', A, \bar{s}) \cdot S)} \text{ESDECLARE}$$

## 5 Gradualization

### 5.1 Syntax

#### 5.1.1 Gradual formula

$$\tilde{\phi} ::= \phi \mid ? * \phi$$

Note: consider  $?$  in other positions as “self-framing delimiter”, but with semantically identical meaning. As long as  $?$  is only legal in the front though:  $\phi_1 * \tilde{\phi}_2$  propagates the  $?$  to the very left in case  $\tilde{\phi}_2$  contains one.

#### 5.1.2 Self-framed and satisfiable formula

$$\hat{\phi} \in \{ \phi \mid \vdash_{\text{sfrm}} \phi \wedge \text{sat } \phi \}$$

### 5.2 Concretization

$$\begin{aligned} \gamma(\hat{\phi}) &= \{ \hat{\phi} \} \\ \gamma(? * \phi') &= \{ \hat{\phi} \mid \hat{\phi} \implies \phi' \} \text{ if } \phi' \text{ satisfiable} \\ \gamma(\phi) &\text{ undefined otherwise} \end{aligned}$$

$$\tilde{\phi}_1 \sqsubseteq \tilde{\phi}_2 : \iff \gamma(\tilde{\phi}_1) \subseteq \gamma(\tilde{\phi}_2)$$

### 5.3 Abstraction

$$\alpha(\bar{\phi}) = \min_{\sqsubseteq} \{ \tilde{\phi} \mid \bar{\phi} \subseteq \gamma(\tilde{\phi}) \}$$

Equivalent to:

$$\begin{aligned} \alpha(\{\phi\}) &= \phi \\ \alpha(\bar{\phi}) &= \dot{\alpha}(\bar{\phi}) := \sup_{\sqsubseteq} \{ ? * \phi \mid \phi \in \bar{\phi} \} \end{aligned}$$

Proved:

- partial function
- sound
- optimal
- $\alpha(\gamma(\tilde{\phi})) = \tilde{\phi}$
- does this make  $\langle \gamma, \alpha \rangle$  a (partial) “galois insertion”?

## 5.4 Lifting functions

Gradual lifting  $\tilde{f} : \tilde{\phi} \rightarrow \tilde{\phi}$  of a function  $f : \phi \rightarrow \phi$ :

$$\tilde{f}(\tilde{\phi}) := \alpha(\bar{f}(\gamma(\tilde{\phi})))$$

This formal definition has drawbacks:

- Calculations on infinite set (not implementable)
- Determine supremum of infinite set (not even clear if it exists)

Turns out above definition can be rewritten in an equivalent, computable way.

### 5.4.1 Dominator Theory

TODO: first tackle singleton case etc.

Theorem:

For every  $\phi$ , there exists a finite set of “dominators”  $\mathbf{dom}(\phi)$ , such that

$$\gamma(? * \phi) = \bigcup_{\hat{\phi} \in \mathbf{dom}(f(\phi))} \gamma(? * \hat{\phi})$$

Consequence:

$$\begin{aligned} ? * \phi &= \alpha(\gamma(? * \phi)) \\ &= \dot{\alpha}(\gamma(? * \phi)) \\ &= \dot{\alpha}\left(\bigcup_{\hat{\phi} \in \mathbf{dom}(\phi)} \gamma(? * \hat{\phi})\right) \\ &= \dot{\alpha}\left(\bigcup_{\hat{\phi} \in \mathbf{dom}(\phi)} \{\hat{\phi}\}\right) \\ &= \dot{\alpha}(\mathbf{dom}(\phi)) \\ &= \sup_{\sqsubseteq} \{ ? * \phi' \mid \phi' \in \mathbf{dom}(\phi) \} \end{aligned}$$

Analogous, for monotonic  $f$ :

$$\begin{aligned} &\alpha(\bar{f}(\gamma(? * \phi))) \\ &= \dot{\alpha}(\bar{f}(\gamma(? * \phi))) \\ &= \dot{\alpha}(\bar{f}\left(\bigcup_{\hat{\phi} \in \mathbf{dom}(\phi)} \gamma(? * \hat{\phi})\right)) \\ &= \dot{\alpha}(\bar{f}\left(\bigcup_{\hat{\phi} \in \mathbf{dom}(\phi)} \{\hat{\phi}\}\right)) \\ &= \dot{\alpha}(\bar{f}(\mathbf{dom}(\phi))) \\ &= \sup_{\sqsubseteq} \{ ? * f(\phi') \mid \phi' \in \mathbf{dom}(\phi) \} \end{aligned}$$

Re-definition of gradual lifting:

$$\begin{aligned} \tilde{f}(\phi) &:= f(\phi) \\ \tilde{f}(? * \phi) &:= \alpha(\bar{f}(\gamma(? * \phi))) = \dot{\alpha}(\bar{f}(\mathbf{dom}(\phi))) \end{aligned}$$

In terms of implementation: At least no more infinite sets, need to calculating supremum remains.

Interesting observation:

$$\tilde{f}(? * \hat{\phi}) = \dot{\alpha}(\bar{f}(\mathbf{dom}(\hat{\phi}))) = \dot{\alpha}(\bar{f}(\{\hat{\phi}\})) = \dot{\alpha}(\{f(\hat{\phi})\}) = ? * f(\hat{\phi})$$

This observation raises the question whether it is possible to generalize the equality to work with arbitrary formulas, getting rid of  $\dot{\alpha}$  and calculating a supremum entirely.

### 5.4.2 Generalization: Auto-liftable functions

Goal: Get a definition of  $\tilde{f}$  that is even easier to handle and implement. Therefore we want to investigate whether, or under which circumstances

$$\tilde{f}(\tilde{\phi}) = f(\tilde{\phi}) \quad (\text{i.e. } f \text{ applied to the static part of } \tilde{\phi})$$

holds.

We call functions  $f$  satisfying above equality “auto-liftable”.

Counterexamples:

- $f(\phi) = \text{acc}(x.f) * \phi$

$$\tilde{f}(? * x.f = 3) = ? * \text{false} \neq ? * \text{acc}(x.f) * (x.f = 3) = f(? * (x.f = 3))$$

Cause:  $\gamma(? * x.f = 3)$  only contains self-framed formulas, so access to  $x.f$  is always included. Adding it another time results in duplicate access and therefore unsatisfiable formulas.

- $f(\phi) = \text{remove all terms containing } x$

$$\tilde{f}(? * a = 3) = ? \neq ? * (a = 3) = f(? * (a = 3))$$

Cause:  $(a = x) * (x = 3) \in \gamma(? * a = 3)$  and  $f((a = x) * (x = 3)) = \text{true}$ . Abstracting from a (non-singleton) set that contains **true** yields  $?$ .

What is necessary to generalize this as  $\alpha(\bar{f}(\gamma(? * \phi))) = ? * f(\phi)$ ?

$$\begin{aligned} & \forall \phi' \in \gamma(? * f(\phi)), \exists \phi'' \in \gamma(? * \phi), \phi' \in \gamma(? * f(\phi'')) \\ & \implies \\ & \forall \phi' \in \gamma(? * f(\phi)), \exists \phi'' \in \gamma(? * \phi), ? * \phi' \sqsubseteq ? * f(\phi'') \\ & \implies \\ & \forall \phi' \in \text{dom}(f(\phi)), \exists \phi'' \in \text{dom}(\phi), ? * \phi' \sqsubseteq ? * f(\phi'') \\ & \implies \\ & \forall \phi' \in \text{dom}(f(\phi)), ? * \phi' \sqsubseteq \sup_{\sqsubseteq} \{ ? * f(\phi') \mid \phi' \in \text{dom}(\phi) \} \\ & \iff \\ & \sup_{\sqsubseteq} \{ ? * \phi' \mid \phi' \in \text{dom}(f(\phi)) \} \sqsubseteq \sup_{\sqsubseteq} \{ ? * f(\phi') \mid \phi' \in \text{dom}(\phi) \} \\ & \iff \\ & ? * f(\phi) \sqsubseteq \alpha(\bar{f}(\gamma(? * \phi))) \\ & \\ & ? * f(\phi) \sqsubseteq ? * f(\phi) \\ & \implies \\ & \forall \phi' \in \text{dom}(\phi), ? * f(\phi') \sqsubseteq ? * f(\phi) \\ & \iff \\ & \sup_{\sqsubseteq} \{ ? * f(\phi') \mid \phi' \in \text{dom}(\phi) \} \sqsubseteq ? * f(\phi) \\ & \iff \\ & \alpha(\bar{f}(\gamma(? * \phi))) \sqsubseteq ? * f(\phi) \end{aligned}$$

For a function  $f$  to be auto-liftable, the following properties are sufficient:

- Monotonicity
- $\forall \phi' \in \gamma(? * f(\phi)), \exists \phi'' \in \gamma(? * \phi), \phi' \in \gamma(? * f(\phi''))$

### 5.4.3 Lifiable composition

Given liftable functions  $f$  and  $g$ , is  $g \circ f$  liftable? Monotonicity is obviously preserved. Other condition:

$$\begin{aligned}
& ? * g(f(\phi)) \sqsubseteq \alpha(\overline{g}(\gamma(? * f(\phi)))) \wedge ? * f(\phi) \sqsubseteq \alpha(\overline{f}(\gamma(? * \phi))) \\
& \implies \\
& ? * g(f(\phi)) \sqsubseteq \alpha(\overline{g}(\gamma(? * f(\phi)))) \wedge \alpha(\gamma(? * f(\phi))) \sqsubseteq \alpha(\overline{f}(\gamma(? * \phi))) \\
& \implies \\
& ? * g(f(\phi)) \sqsubseteq \alpha(\overline{g}(\gamma(? * f(\phi)))) \wedge \alpha(\overline{g}(\gamma(? * f(\phi)))) \sqsubseteq \alpha(\overline{g}(\overline{f}(\gamma(? * \phi)))) \\
& \implies \\
& ? * g(f(\phi)) \sqsubseteq \alpha(\overline{g}(\overline{f}(\gamma(? * \phi)))) \\
& \implies \\
& ? * (g \circ f)(\phi) \sqsubseteq \alpha(\overline{(g \circ f)}(\gamma(? * \phi)))
\end{aligned}$$

## 5.5 Gradual Lifting

### 5.5.1 Self framing

$$\frac{A \vdash_{\text{sfrm}} \phi}{A \vdash_{\text{sfrm}} \phi} \text{GSFRMNONGRAD}$$

$$\frac{}{A \vdash_{\text{sfrm}} ? * \phi} \text{GSFRMGRAD}$$

### 5.5.2 Implication

$$\frac{\phi_1 \implies \phi_2}{\phi_1 \widetilde{\implies} \phi_2} \text{GIMPLNONGRAD}$$

$$\frac{\hat{\phi}_m \implies \phi_2 \quad \hat{\phi}_m \implies \phi_1}{? * \phi_1 \widetilde{\implies} \phi_2} \text{GIMPLGRAD}$$

$\hat{\phi}_m$  is evidence!

### Consistent transitivity

While  $\implies$  is transitive,  $\widetilde{\implies}$  is generally not.

But maybe not even necessary with smarter hoare rules?

### 5.5.3 Equality

$$\frac{\phi_1 = \phi_2}{\phi_1 \approx \phi_2} \text{GEQSTATIC}$$

$$\frac{\text{at least one of } \widetilde{\phi_1} \text{ or } \widetilde{\phi_2} \text{ contains ?} \quad \widetilde{\phi_1} \widetilde{\implies} \widetilde{\phi_2} \quad \widetilde{\phi_2} \widetilde{\implies} \widetilde{\phi_1}}{\widetilde{\phi_1} \approx \widetilde{\phi_2}} \text{GEQGRADUAL}$$

### 5.5.4 Append

by definition:

$$\tilde{\phi} \tilde{*} \phi_p = \alpha(\gamma(\tilde{\phi}) \bar{*} \phi_p)$$

equivalent to:

$$\begin{array}{ll} \tilde{\phi} \tilde{*} \phi_p = \tilde{\phi} * \phi_p & \text{if } \forall \hat{\phi}_1, (\hat{\phi}_1 \implies \phi * \phi_p) \implies \exists \hat{\phi}_2, (\hat{\phi}_2 \implies \phi \wedge \hat{\phi}_1 \implies \hat{\phi}_2 * \phi_p) \\ & \text{if } \forall \hat{\phi}_1 \in \gamma(\tilde{\phi} * \phi_p), \exists \hat{\phi}_2 \in \gamma(\tilde{\phi}), \hat{\phi}_1 \implies \hat{\phi}_2 * \phi_p \\ \tilde{\phi} \tilde{*} \phi_p \text{ undefined} & \text{otherwise} \end{array}$$

## 5.6 Gradual Hoare: minimal static rule approach

Example:

$$\frac{\emptyset \vdash_{\text{sfrm}} \tilde{\phi}' \quad x \notin FV(\tilde{\phi}') \quad \epsilon \vdash \tilde{\phi} \widetilde{\implies} \tilde{\phi}' \quad x \notin FV(e) \quad \epsilon \vdash \tilde{\phi} \vdash x : T \quad \epsilon \vdash \tilde{\phi} \vdash e : T \quad \epsilon \vdash [\tilde{\phi}] \vdash_{\text{sfrm}} e}{\vdash \{\tilde{\phi}\}x := e\{\tilde{\phi}' * (x = e)\}} \text{GHVARASSIGN}$$

Collapsing (hidden) gradual implications into a single one:

$$\frac{\epsilon \vdash \tilde{\phi} \widetilde{\implies} (x : T) * \llbracket e : T \rrbracket_C * \tilde{\phi}' \quad \emptyset \vdash_{\text{sfrm}} \llbracket e : T \rrbracket_C * \tilde{\phi}' \quad x \notin FV(\tilde{\phi}') \quad x \notin FV(e) \quad [e : T]_C}{\vdash \{\tilde{\phi}\}x := e\{\llbracket e : T \rrbracket_C * \tilde{\phi}' * (x = e)\}} \text{GHVARASSIGN}$$

When shifting implication responsibility to GHSec:

$$\frac{x \notin FV(\tilde{\phi}') \quad x \notin FV(e) \quad [e : T]_C}{\vdash \{(x : T) * \llbracket e : T \rrbracket_C * \tilde{\phi}'\}x := e\{\llbracket e : T \rrbracket_C * \tilde{\phi}' * (x = e)\}} \text{GHVARASSIGN}$$

Example derivation:

$$\begin{array}{l} \{(x : T) * (y : C) * \text{acc}(y.a) * \text{acc}(y.a.b) * \text{acc}(y.a.b.c) * \tilde{\phi}'\} \\ \{(x : T) * \llbracket y.a.b.c : T \rrbracket_C * \tilde{\phi}'\} \\ x := y.a.b.c; \quad \begin{array}{l} x \notin FV(\tilde{\phi}') \\ x \notin FV(y.a.b.c) \\ [y.a.b.c : T]_C = \vdash C_y = C \wedge \vdash C_y.a : C_a \wedge \vdash C_a.b : C_b \wedge \vdash C_b.c : T \end{array} \\ \{\llbracket y.a.b.c : T \rrbracket_C * \tilde{\phi}' * (x = y.a.b.c)\} \\ \{(y : C) * \text{acc}(y.a) * \text{acc}(y.a.b) * \text{acc}(y.a.b.c) * \tilde{\phi}' * (x = y.a.b.c)\} \end{array}$$

### 5.6.1 GHFieldAssign

$$\frac{\vdash_{\text{sfrm}} \phi \quad \vdash C.f : T \quad \tilde{\phi}_1 \approx (x : C) * (y : T) * (x \neq \text{null}) * \phi * \text{acc}(x.f) \quad \tilde{\phi}_2 \approx (x : C) * \text{acc}(x.f) * (x \neq \text{null}) * (x.f = y) * \phi}{\vdash \{\tilde{\phi}_1\}x.f := y\{\tilde{\phi}_2\}} \text{GHFIELDASSIGN}$$

### 5.6.2 GHSec - sound but obviously not complete!

$$\frac{\tilde{\vdash}\{\tilde{\phi}_p\}s_1\{\tilde{\phi}_{q1}\} \quad \phi_{q1} \implies \phi_{q2} \quad \emptyset \vdash_{\text{sfrm}} \phi_{q2} \quad \tilde{\vdash}\{\phi_{q2}\}s_2\{\tilde{\phi}_r\}}{\tilde{\vdash}\{\tilde{\phi}_p\}s_1; s_2\{\tilde{\phi}_r\}} \text{GHSEC}$$

## 5.7 Gradual Hoare: minimal HSec approach (implications per rule)

$$\frac{\begin{array}{c} \vdash_{\text{sfrm}} \phi \quad \vdash C.f : T \\ \phi_1 \implies (x : C) * (y : T) * \phi * \text{acc}(x.f) \quad \phi_2 = (x : C) * \text{acc}(x.f) * (x.f = y) * \phi \end{array}}{\vdash \{\phi_1\}x.f := y\{\phi_2\}} \text{HFIELDASSIGN}$$

$$\frac{\begin{array}{c} \vdash_{\text{sfrm}} \phi \quad \vdash C.f : T \\ \widetilde{\phi}_1 \widetilde{\implies} (x : C) * (y : T) * \phi * \text{acc}(x.f) \quad \widetilde{\phi}_2 \approx (x : C) * \text{acc}(x.f) * (x.f = y) * \phi \end{array}}{\vdash \{\widetilde{\phi}_1\}x.f := y\{\widetilde{\phi}_2\}} \text{GHFIELDASSIGN}$$

Note: With this alternative rule design  $\widetilde{\implies}$  is consistently used with static formulas as second argument. This plays nicely with the fact that  $\widetilde{\implies}$  does not care about the gradualness of that argument. Might make sense to define lifting of  $\implies$  as lifting on only the first parameter in the first place.

**Minimum runtime checks:** For  $\widetilde{\phi}_1 \widetilde{\implies} \widetilde{\phi}_2$  to hold at runtime, practically just  $\phi_2$  needs to hold. So that would be a valid assertion to check. Yet, we know statically that  $\phi_1$  holds, so we can remove everything from the runtime check that is implied by  $\phi_1$ . So in a sense, we only need to check  $\phi_2 \setminus \phi_1$  at runtime (the operator can be an approximation).

## 5.8 Gradual Hoare: deterministic approach

### 5.8.1 HFieldAssign

$$\frac{\begin{array}{c} \vdash C.f : T \\ \phi_1 \implies (x : C) * (y : T) * \text{acc}(x.f) \quad \phi_2 = (x : C) * \text{acc}(x.f) * (x.f = y) * \phi_1[\mathbf{w/o} \text{acc}(x.f)] \end{array}}{\vdash \{\phi_1\}x.f := y\{\phi_2\}} \text{HFIELDASSIGN}$$

Note:  $\phi[\mathbf{w/o} \text{acc}(x.f)]$  removes  $\text{acc}(x.f)$  and all uses of  $x.f$  from  $\phi$ . The result is self-framed given that  $\phi$  is.

**Attention:** This version is weaker than the other (pairwise equivalent) versions of HFieldAssign!

Explanation: Above operator may remove more information than necessary from  $\phi$ .

Example:

- Given:  $\phi_1 = \text{acc}(x.f) * (x.f = a) * (x.f = b)$
- Goal:  $\phi_2 \implies (a = b)$
- **not provable** with this deterministic version of HFieldAssign
- **provable** with all other versions

Probably it's possible to apply the operator without information loss after expanding formula using equalities (transitive hull).

### 5.8.2 GHFieldAssign

(= gradual lifting of GHFieldAssign as function)

$$\frac{\widetilde{\phi}_2 = \alpha(\{\phi_2 \mid \phi_1 \in \gamma(\widetilde{\phi}_1) \wedge \vdash \{\phi_1\}x.f := y\{\phi_2\}\})}{\vdash \{\widetilde{\phi}_1\}x.f := y\{\widetilde{\phi}_2\}} \text{GHFIELDASSIGN}$$

Which should be equivalent to this:

$$\frac{\begin{array}{c} \vdash C.f : T \\ \phi_1 \implies (x : C) * (y : T) * \text{acc}(x.f) \\ \phi_2 = (x : C) * (y : T) * \text{acc}(x.f) * (x.f = y) * \phi_1[\mathbf{w/o} \text{acc}(x.f)] \end{array}}{\vdash \{\phi_1\}x.f := y\{\phi_2\}} \text{GHFA1}$$

$$\frac{\begin{array}{c} \vdash C.f : T \\ ? * \phi_1 \widetilde{\Rightarrow}_{\phi_m} (x : C) * \mathbf{acc}(x.f) \\ \phi_2 = (x : C) * \mathbf{acc}(x.f) * (x.f = y) * \phi_m[\mathbf{w/o} \mathbf{acc}(x.f)] \end{array}}{\widetilde{\vdash} \{ ? * \phi_1 \} x.f := y \{ ? * \phi_2 \}} \text{GHFA2}$$

Which should be summarizable as this:

$$\frac{\begin{array}{c} \vdash C.f : T \\ \widetilde{\phi}_1 \widetilde{\Rightarrow}_{\widetilde{\phi}_m} (x : C) * (y : T) * \mathbf{acc}(x.f) \\ \widetilde{\phi}_2 = (x : C) * \mathbf{acc}(x.f) * (x.f = y) * \widetilde{\phi}_m[\mathbf{w/o} \mathbf{acc}(x.f)] \end{array}}{\widetilde{\vdash} \{ \widetilde{\phi}_1 \} x.f := y \{ \widetilde{\phi}_2 \}} \text{GHFA}$$

Which for well-formed programs is equivalent to:

$$\frac{\begin{array}{c} \vdash C.f : T \\ \phi_1 \Rightarrow (x : C) * (y : T) \quad \widetilde{\phi}_1 \widetilde{\Rightarrow} \mathbf{acc}(x.f) \\ \widetilde{\phi}_2 = (x : C) * (y : T) * \mathbf{acc}(x.f) * (x.f = y) * \widetilde{\phi}_1[\mathbf{w/o} \mathbf{acc}(x.f)] \end{array}}{\widetilde{\vdash} \{ \widetilde{\phi}_1 \} x.f := y \{ \widetilde{\phi}_2 \}} \text{GHFA}$$

Observations:

- $\widetilde{\phi}_m$  is the interior (first argument) of the implication, effectively the meet of first and second argument.
- for the gradual rules to work, the **w/o**-operator **must** be implemented with minimal information loss

## 5.9 Theorems

### 5.9.1 Soundness of $\alpha$

$$\forall \bar{\phi} : \bar{\phi} \subseteq \gamma(\alpha(\bar{\phi}))$$

### 5.9.2 Optimality of $\alpha$

$$\forall \bar{\phi}, \tilde{\phi} : \bar{\phi} \subseteq \gamma(\tilde{\phi}) \implies \gamma(\alpha(\bar{\phi})) \subseteq \gamma(\tilde{\phi})$$

## 6 Theorems

### 6.1 Invariant $\text{invariant}(H, \rho, A_d, \phi)$

#### 6.1.1 Phi valid

$$\vdash_{\mathbf{sfrm}} \phi$$

#### 6.1.2 Phi holds

$$H, \rho, A_d \models \phi$$

#### 6.1.3 Types preserved

$$\begin{array}{l} \forall e, T : \phi \vdash e : T \\ \implies H, \rho \vdash e : T \end{array}$$

### 6.1.4 Heap consistent

$$\begin{aligned}
& \forall o, C, \mu, f, T : H(o) = (C, \mu) \\
& \implies \text{fieldType}(C, f) = T \\
& \implies H, \rho \vdash \mu(f) : T
\end{aligned}$$

### 6.1.5 Heap not total

$$\begin{aligned}
& \exists o_{min} : \\
& \forall o \geq o_{min} : o \notin \text{dom}(H) \\
& \quad \wedge \forall f, (o, f) \notin A
\end{aligned}$$

## 6.2 Soundness

### 6.2.1 Progress

$$\begin{aligned}
& \forall \dots : \vdash \{\phi_1\} s' \{\phi_2\} \\
& \implies \text{invariant}(H_1, \rho_1, A_1, \phi_1) \\
& \implies \exists H_2, \rho_2, A_2 : (H_1, (\rho_1, A_1, s'; \bar{s}) \cdot S) \rightarrow^* (H_2, (\rho_2, A_2, \bar{s}) \cdot S)
\end{aligned}$$

### 6.2.2 Preservation

$$\begin{aligned}
& \forall \dots : \vdash \{\phi_1\} s' \{\phi_2\} \\
& \implies \text{invariant}(H_1, \rho_1, A_1, \phi_1) \\
& \implies (H_1, (\rho_1, A_1, s'; \bar{s}) \cdot S) \rightarrow^* (H_2, (\rho_2, A_2, \bar{s}) \cdot S) \\
& \implies \text{invariant}(H_2, \rho_2, A_2, \phi_2)
\end{aligned}$$
